

## Product Change Notification - SYST-17XTEX827

---

**Date:**

23 Jan 2019

**Product Category:**

Power Management - Power Switches

**Affected CPNs:**

**Notification subject:**

Data Sheet - MIC2025/2075 - Single-Channel Power Distribution Switch MM8®

**Notification text:**

SYST-17XTEX827

Microchip has released a new DeviceDoc for the MIC2025/2075 - Single-Channel Power Distribution Switch MM8®; of devices. If you are using one of these devices please read the document located at [MIC2025/2075 - Single-Channel Power Distribution Switch MM8®](#).

**Notification Status:** Final

**Description of Change:**

- 1) Converted Micrel document MIC2025/2075 to Microchip data sheet DS20006030A.
- 2) Minor text changes throughout.

**Impacts to Data Sheet:** None

**Reason for Change:** To Improve Manufacturability

**Change Implementation Status:** Complete

**Date Document Changes Effective:** 20 Aug 2018

**NOTE:** Please be advised that this is a change to the document only the product has not been changed.

**Markings to Distinguish Revised from Unrevised Devices:** N/A

**Revision History:**

**August 20, 2018:** Issued the datasheet change PCN.

**January 23, 2019:** Re-issued this PCN due to system error.

**Attachment(s):**

## Single-Channel Power Distribution Switch

### Features

- 140 mΩ Maximum On-Resistance
- 2.7V to 5.5V Operating Range
- 500 mA Minimum Continuous Output Current
- Short-Circuit Protection with Thermal Shutdown
- Fault Status Flag with 3 ms Filter Eliminates False Assertions
- Undervoltage Lockout
- Reverse Current Flow Blocking (No “Body Diode”)
- Circuit Breaker Mode (MIC2075) Reduces Power Consumption
- Logic-Compatible Input
- Soft-Start Circuit
- Low Quiescent Current
- Pin Compatible with MIC2525
- UL File #E179633

### Applications

- USB Peripherals
- General Purpose Power Switching
- ACPI Power Distribution
- Notebook PCs
- PDAs
- PC Card Hot Swap

### General Description

The MIC2025 and MIC2075 are high-side MOSFET switches optimized for general-purpose power distribution requiring circuit protection.

The MIC2025/75 are internally current limited and have thermal shutdown that protects the device and load. The MIC2075 offers “smart” thermal shutdown that reduces current consumption in fault modes. When a thermal shutdown fault occurs, the output is latched off until the faulty load is removed. Removing the load or toggling the enable input will reset the device output.

Both devices employ soft-start circuitry that minimizes inrush current in applications where highly capacitive loads are employed. A fault status output flag is provided that is asserted during overcurrent and thermal shutdown conditions.

The MIC2025/75 are available in the 8-Pin MSOP and 8-Pin SOIC packages.

### Package Type

# MIC2025/2075

## Functional Block Diagram

## Typical Application Circuit

## 1.0 ELECTRICAL CHARACTERISTICS

### Absolute Maximum Ratings †

Supply Voltage ( $V_{IN}$ )	-0.3V to +6V
Fault Flag Voltage ( $V_{FLG}$ )	+6V
Fault Flag Current ( $I_{FLG}$ )	25 mA
Output Voltage ( $V_{OUT}$ )	+6V
Output Current ( $I_{OUT}$ )	Internally Limited
Enable Input ( $I_{EN}$ )	-0.3V to $V_{IN} + 3V$
ESD Rating	(Note 1)

### Operating Ratings ‡

Supply Voltage ( $V_{IN}$ )	+2.7V to +5.5V
-----------------------------	----------------

† **Notice:** Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational sections of this specification is not intended. Exposure to maximum rating conditions for extended periods may affect device reliability. Specifications are for packaged product only.

‡ **Notice:** The device is not guaranteed to function outside its operating ratings.

**Note 1:** Devices are ESD sensitive. Handling precautions are recommended.

**TABLE 1-1: ELECTRICAL CHARACTERISTICS**

**Electrical Characteristics:**  $V_{IN} = +5V$ ;  $T_A = +25^\circ C$ , **Bold** values indicate  $-40^\circ C \leq T_A \leq +85^\circ C$ ; unless otherwise specified.

Parameter	Symbol	Min.	Typ.	Max.	Units	Conditions
Supply Current	$I_{DD}$	—	0.75	<b>5</b>	$\mu A$	MIC20x5-1, $V_{EN} \leq 0.8V$ (switch off), OUT = open

## 3.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in [Table 3-1](#).

**TABLE 3-1: PIN FUNCTION TABLE**

Pin Number	Pin Name	Description
1	EN	Switch Enable (Input): Active-high (-1) or Active-low (-2).
2	FLG	Fault Flag (Output): Active-low, open-drain output. Indicates overcurrent or thermal shutdown conditions. Overcurrent condition must exceed $t_D$ in order to assert FLG.
3	GND	Ground.
4	NC	Not internally connected.
5	NC	Not internally connected.
6, 8	OUT	Supply (Output): Pins must be connected together.
7	IN	Supply voltage (Input).

## 4.0 FUNCTIONAL DESCRIPTION

### 4.1 Input and Output

IN is the power supply connection to the logic circuitry and the drain of the output MOSFET. OUT is the source of the output MOSFET. In a typical circuit, current flows from IN to OUT toward the load. If  $V_{OUT}$  is greater than  $V_{IN}$ , current will flow from OUT to IN, since the switch is bidirectional when enabled. The output MOSFET and driver circuitry are also designed to allow the MOSFET source to be externally forced to a higher voltage than the drain ( $V_{OUT} > V_{IN}$ ) when the switch is disabled. In this situation, the MIC2025/75 prevents undesirable current flow from OUT to IN.

### 4.2 Thermal Shutdown

Thermal shutdown is employed to protect the device from damage should the die temperature exceed safe margins due mainly to short circuit faults. Thermal shutdown shuts off the output MOSFET and asserts the FLG output if the die temperature reaches 140°C. The MIC2025 will automatically reset its output should the die temperature cool down to 120°C. The MIC2025 output and FLG signal will continue to cycle on and off until the device is disabled or the fault is removed. [Figure 4-2](#) depicts typical timing. If the MIC2075 goes into thermal shutdown, its output will latch off and a pull-up current source is activated. This allows the output latch to automatically reset when the load (such as a USB device) is removed. The output can also be reset by toggling EN. Refer to [Figure 4-1](#) for details.

Depending on PCB layout, package, ambient temperature, etc., it may take several hundred milliseconds from the incidence of the fault to the output MOSFET being shut off. The worst-case scenario of thermal shutdown is that of a short-circuit fault and is shown in [Figure 2-25](#) and [Figure 2-26](#).

**FIGURE 4-1:** MIC2075-2 Timing: Output Reset by Removing Load.

**FIGURE 4-2:** MIC2025-2 Timing.

### 4.3 Power Dissipation

The device's junction temperature depends on several factors such as the load, PCB layout, ambient temperature, and package type. Equations that can be used to calculate power dissipation and junction temperature are found in [Equation 4-1](#) and [Equation 4-2](#).

#### EQUATION 4-1:

$$P_D = R_{DS(on)} \times I_{OUT}^2$$

#### EQUATION 4-2:

$$T_J = P_D \times \theta_{JA} + T_A$$

Where:

- $T_J$  = Junction Temperature
- $T_A$  = Ambient Temperature
- $\theta_{JA}$  = The Thermal Resistance of the Package

### 4.4 Current Sensing and Limiting

The current-limit threshold is preset internally. The preset level prevents damage to the device and external load but still allows a minimum current of 500 mA to be delivered to the load.

The current-limit circuit senses a portion of the output MOSFET switch current. The current-sense resistor shown in the [Functional Block Diagram](#) is virtual and has no voltage drop. The reaction to an overcurrent condition varies with three scenarios:

## 4.4.1 SWITCH ENABLED INTO SHORT-CIRCUIT

If a switch is enabled into a heavy load or short-circuit, the switch immediately enters into a constant-current mode, reducing the output voltage. The FLG signal is asserted indicating an overcurrent condition. See [Figure 2-21](#).

## 4.4.2 SHORT-CIRCUIT APPLIED TO ENABLED OUTPUT

When a heavy load or short-circuit is applied to an enabled switch, a large transient current may flow until the current-limit circuitry responds. Once this occurs, the device limits current to less than the short-circuit current limit specification. See [Figure 2-23](#).

## 4.4.3 CURRENT-LIMIT RESPONSE - RAMPED LOAD

The MIC2025/75 current-limit profile exhibits a small foldback effect of about 200 mA. Once this current-limit threshold is exceeded the device switches into a constant current mode. It is important to note that the device will supply current until the current-limit threshold is exceeded. See [Figure 2-22](#).

## 4.5 Fault Flag

The FLG signal is an N-channel open-drain MOSFET output. FLG is asserted (active-low) when either an overcurrent or thermal shutdown condition occurs. In the case of an overcurrent condition, FLG will be asserted only after the flag response delay time,  $t_D$ , has elapsed. This ensures that FLG is asserted only upon valid overcurrent conditions and that erroneous error reporting is eliminated. For example, false overcurrent conditions can occur during hot plug events when a highly capacitive load is connected and causes a high transient inrush current that exceeds the current-limit threshold. The FLG response delay time  $t_D$  is typically 3 ms.

## 4.6 Undervoltage Lockout

Undervoltage lockout (UVLO) prevents the output MOSFET from turning on until  $V_{IN}$  exceeds approximately 2.5V. Undervoltage detection functions only when the switch is enabled.

## 5.0 APPLICATION INFORMATION

### 5.1 Supply Filtering

A 0.1  $\mu\text{F}$  to 1  $\mu\text{F}$  bypass capacitor positioned close to VIN and GND of the device is strongly recommended to control supply transients. Without a bypass capacitor, an output short may cause sufficient ringing on the input (from supply lead inductance) to damage internal control circuitry.

### 5.2 Printed Circuit Board Hot-Plug

The MIC2025/75 are ideal inrush current-limiters for hot plug applications. Due to their integrated charge pumps, the MIC2025/75 present a high impedance when off and slowly become a low impedance as their integrated charge pumps turn on. This soft-start feature effectively isolates power supplies from highly capacitive loads by reducing inrush current. Equation 5-1 shows how the MIC2075 may be used in a card hot-plug application.

In cases of extremely large capacitive loads ( $>400 \mu\text{F}$ ), the length of the transient due to inrush current may exceed the delay provided by the integrated filter. Since this inrush current exceeds the current-limit delay specification, FLG will be asserted during this time. To prevent the logic controller from responding to FLG being asserted, an external RC filter, as shown in Equation 5-2, can be used to filter out transient FLG assertion. The value of the RC time constant should be selected to match the length of the transient, less  $t_{D(\text{min})}$  of the MIC2025/75.

### 5.3 Universal Serial Bus (USB) Power Distribution

The MIC2025/75 are ideally suited for USB (Universal Serial Bus) power distribution applications. The USB specification defines power distribution for USB host systems such as PCs and USB hubs. Hubs can either be self-powered or bus-powered (that is, powered from the bus). Equation 5-3 shows a typical USB Host application that may be suited for mobile PC applications employing USB. The requirement for USB host systems is that the port must supply a minimum of 500 mA at an output voltage of  $5\text{V} \pm 5\%$ . In addition, the output power delivered must be limited to below 25 VA. Upon an overcurrent condition, the host must also be notified. To support hot-plug events, the hub must have a minimum of 120  $\mu\text{F}$  of bulk capacitance, preferably low ESR electrolytic or tantalum. Please refer to Application Note 17 for more details on designing compliant USB hub and host systems.

For bus-powered hubs, USB requires that each downstream port be switched on or off under control by the host. Up to four downstream ports each capable of supplying 100 mA at 4.4V minimum are allowed. In addition, to reduce voltage droop on the upstream

$V_{\text{BUS}}$ , soft-start is necessary. Although the hub can consume up to 500 mA from the upstream bus, the hub must consume only 100 mA max at start-up, until it enumerates with the host prior to requesting more power. The same requirements apply for bus-powered peripherals that have no downstream ports. Equation 5-4 shows a bus-powered hub.

FIGURE 5-1: Hot-Plug Application.

FIGURE 5-2: Transient Filter.

---

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

*Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.*

### Trademarks

The Microchip name and logo, the Microchip logo, AnyRate, AVR, AVR logo, AVR Freaks, BeaconThings, BitCloud, CryptoMemory, CryptoRF, dsPIC, FlashFlex, flexPWR, Heldo, JukeBlox, KEELOQ, KEELOQ logo, Klear, LANCheck, LINK MD, maXStylus, maXTouch, MediaLB, megaAVR, MOST, MOST logo, MPLAB, OptoLyzer, PIC, picoPower, PICSTART, PIC32 logo, Prochip Designer, QTouch, RightTouch, SAM-BA, SpyNIC, SST, SST Logo, SuperFlash, tinyAVR, UNI/O, and XMEGA are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

ClockWorks, The Embedded Control Solutions Company, EtherSynch, Hyper Speed Control, HyperLight Load, IntelliMOS, mTouch, Precision Edge, and Quiet-Wire are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Adjacent Key Suppression, AKS, Analog-for-the-Digital Age, Any Capacitor, AnyIn, AnyOut, BodyCom, chipKIT, chipKIT logo, CodeGuard, CryptoAuthentication, CryptoCompanion, CryptoController, dsPICDEM, dsPICDEM.net, Dynamic Average Matching, DAM, ECAN, EtherGREEN, In-Circuit Serial Programming, ICSP, Inter-Chip Connectivity, JitterBlocker, KlearNet, KlearNet logo, Mindi, MiWi, motorBench, MPASM, MPF, MPLAB Certified logo, MPLIB, MPLINK, MultiTRAK, NetDetach, Omniscient Code Generation, PICDEM, PICDEM.net, PICKit, PICTail, PureSilicon, QMatrix, RightTouch logo, REAL ICE, Ripple Blocker, SAM-ICE, Serial Quad I/O, SMART-I.S., SQI, SuperSwitcher, SuperSwitcher II, Total Endurance, TSHARC, USBCheck, VariSense, ViewSpan, WiperLock, Wireless DNA, and ZENA are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

Silicon Storage Technology is a registered trademark of Microchip Technology Inc. in other countries.

GestIC is a registered trademark of Microchip Technology Germany II GmbH & Co. KG, a subsidiary of Microchip Technology Inc., in other countries.

All other trademarks mentioned herein are property of their respective companies.
